

Formulation
of
biocontrol solutions

From the laboratory to the field, the success of a biocontrol solution depends as much on the quality of the active ingredient as on the performance of its formulation. We support you in developing innovative, effective, and biodegradable formulae, tailoring our approach to your objectives and constraints.

2 Approaches tailored to your needs

1 Do you have an active to value?

We test **several formulae** based on your actives.

→ Selection of the best formula structure.

2 Are you starting with an application problem?

We screen various active ingredients with regard to your target application, using a standard formula.

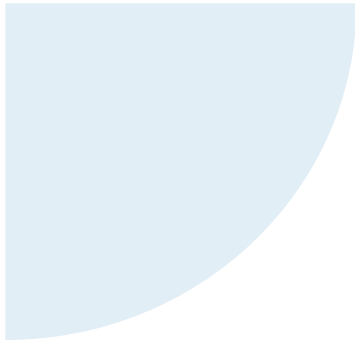

→ Active selection.

Optimization according to applications

We optimize each formulation according to various criteria: effectiveness, stability, cost, biodegradability, and persistence.

The goal is to develop effective and environmentally friendly biocontrol formulae, choosing the most suitable type of formulation—OD, EC, SC, SE, SO, ME—based on the properties of the active ingredient, its use, and the conditions of application.
